We expect to say one of those commands should wake up our code and insert that callback, where we can do it that we like. Follow the code from it to find out what the problem is. This sets the ability to say any of the following commands to Alexa: Alexa, turn on the TV Alexa, turn off the TV Alexa, turn on the television Alexa, turn off the Alexa television, turn on my TV Alexa, turn off my TV Alexa, turn on my own Television Alexa, turn off my television and it is so that we will test it. Look at Fauxmo.h. See the Fauxmo :: Handle () function. Copy the Iremoteesp8266 directory from the â € œLibrarieste directory of the tutorial in the directory â € œLibrariesâ € of Arduino. Just change this line in Alexatvremote.ino: // Initiatilize the IR irsnd = new irsend (ir_pin, false); A // Initiatilize the IR irsnd = new irsend (ir_pin, true); Do you have the control code and command of the right remote control? In the text box â € œFiltroâ €, type â € œesp8266â €. A item should be obtained for â € â € œesp8266â € now that the director of additional cards has added. Tell â € œALEXA, turn on my TV â € or â € œALEXA, turn off my TV. Alexa should understand your command (like a smart command, not aimed at a specific skill), search for a local device to manage it, and send the command to the device (your ESP8266). Your IR diode can be connected in such a way that the signal is substantially reversed. If you did not do it, try to issue a message of debugs inside to make sure that it is the fire when it emits your command. If the TV is off, it should turn on, and if it is on, it should go out. Any Alexa device. The beauty of this technique is that we can use it in our homes to make Alexa automates almost literally everything that works on the electricity. Search for the correct code. To test that the serial debug works: first make sure that the door of be set on serial (tools -> port debug.) now we are going to the meat of the project: the wemo server. test discovery: tell a id lairotut ecidoc led acifidom alled elibasnopser eresse ehcna iarvod am ,eneb av ,odom ortla isaislauq ni iaf ol eS(.atsopsir ni etnetuâlla asoclauq erid id ilgodnasuac ,axelA ovitisopsid la ataivni eneiv ehc atsopsir anu ni ecudart is etnemlamron ;odnamoc led enoitseq al emussa axelA id âlliksâ lI .oniudrA ni erallatsni rep oper tiG id EMDAER elif leuq ni inoizurtsi el eriuges atsaB !++C krowemarf nu rep etnacserfnir otloM .VT artson al erengeps / erednecca ...olritseg id otnemom li ¨Ã ,odnamoc li omaivecir ehc arO RI odnamoc li ignuiggA .eraroval rep hsalf e enoizalipmoc id ossecorp li erenetto rep orol noc eraiccitsap eved is es oserpros eresse non odnecid olos otS ;esab emoc inoizatsopmi eim el erazzilitu retop ad odom ni ,acipit otlom enoizarugifnoc anu ¨Ã aim aL .otsuig olleuq eravort rep elgooG us eravacs inucla eraf revod ebbertop iS .aremacotof al osrevartta RI odoid oblub li etnematterid adrauG .issets iov eraf etervod otseuq e ,6628PSE pihc ortsov la otseuq eragelloc etervoD .asac artsov allen ovitisopsid ortla nu da ataivni atsopsir anu ni ecudart is enif alla ehc ,nozamA id duolc lus âovitisopsid id arbmoâ anu a otazziridni eneiv odnamoc li ,ToI axelA id osac leN .ortla'l noc etnematterid eracinumoc id pihc la e axelA ovitisopsid la ¯Äritnesnoc ehc ²Äic Ã .PCTcnysAPSE airerbil al erallatsni omaibbod ,arO .eter artsov allus âivitisopsid]N[otarevocsidâ ah ehc etnemlabrev Ärid iv axelA ,erirpocs id otinif odnauQ .6628PSE pihc len ecsiresni is otal ortla'l e ,)ved retupmoc li eragelloc rep(BSU ¨Ã otal nu ad ehc elaires erotattehcite eresse ²Äup 0 nip ,6628PSE us otazzilitu enoizaremun id emiger led asuac a ehc ilovepasnoc etaiS .oniciv ¨Ã es e GL VT al erengeps etnemavittemfe ²Äup idniuq ,ffo/no GL odnamoc li aivni Ätlaer nI .ilibitapmoc ivitisopsid irtla e someW rep enoisnacs al ,elacol ifiw eter allus PDU atseihcir anu erettemsari id axelA Äresuac ²ÄiC â.ivitisopsid i irpocs ,axelAâ The command of the speech is addressed to an Alexa “skill” (a program that works in ----------*/ 0 NIP_RI enifed# pihc lus 3d ¨Ã 0 nip // 0069 etar_duab_laires enifed# erawdrah out li eranibba rep atsopmi // issorarfni a etnettim // ;dnesrI *dnesrI yrarbiL RI // >h.6628pseetomerrI< edulcni# .otnel atnevid inoizatserp el e itanimile onnarrev idnamoc i ,)ilravort non(ivitisopsid eredrep a Äreizini axelA ehc osnes len ,elibadiffani eratnevid a izini ehc amirp odotem otseuq odnasu 6628PSE us eriugese ioup eht)ovitisopsid o(revres itnat ¬Äsoc olos onos ic ,eneB .ecilpmes ¹Äip omeW erotalume nu eravort e elgooG us eracrec ioup arO .RI acetoilbib artson allad ion rep itaruc onos ehc ²Äic ottut id ilgatted i , Ätidomoc ortson noc aM ?iFiW la ihgelloc it odnauq ,elaires gubed id atrop al osrevartta erorre ehclauq o erorre id oiggassem nu odnevecir iatS ;"******** = drowssapifiwym*rahc tsnoc ;"***" = dissifiwym*rahc tsnoc ifiw itiderc iout i atsopmI // .lairotut otseuq eraerc id etrap ottut ¨Ã otseuQ .erawdrah out la adnopsirroc odnasu iats ehc olleuq ehc itarucissa O ,).cce ,prahsdneS ,cinosanaPdneS ,gldneS .se da(RI airerbil alled aiccafretni'lleuq us enoiznuf id etamaihc esrevid avorP .atterroc drowssap al noc drowssaPiWyM id erolav li eriutitsos e iFiW eter aut alled etnetu emon li noc dissifiWyM id erolav li eriutitsos id eracitnemid non ,ecidoc led enoipmac leN .atneps e asecca etnemlibisiv anidapmal el ereded itservod ,anoiznuf eS .RI erotittemsart li etnematutepir aiggepmal ecidoc otseuQ .oroval la non ,ed a ecidoc ¨Ã oiggassem nu iuc ni ,©Äs ni otarapes otteggos nu ¨Ã RI acifidoced/acifidoc aL .atamaihc al otatlocsa ah 6628PSE ehc atlov anu otiugese Ärrev ehc ecidoc omirp li ¨Ã otseuQ .lairotut ecidoc led CRS/6628pseetomerI/seirarbiL alletrac allen iav ,amelborp otseuq erevlosir emoc etnemaraihc ¹Äip eredev reP .itratlocsa assop euqnuvo axelA out li ecalP dnE ot dnE .)ebun reggubed reggubed elaires out li ,otailgabs otatsopmi eS //{)(putpes hsalf otats aneppa ¨Ã ecidoc li o osecca ¨Ã ovitisopsid li odnauq ,atlov anu eugese not be readable Serial.begin(SERIAL_BAUD_RATE); //initialize the IR irSend = new IRsend(IR_PIN, true); irSend->begin(); } /*----------*/ //Runs constantly void loop() { irSend->sendNEC(0x20DF10EF, 32, 3); delay(1000); } Begin the ESP8266 Tutorial If everything has worked so far, I think we can be satisfied that our basic equipment and setup are working, and we¢ÂÂÂre ready to begin the meat of the tutorial. Though in real life you can¢ÂÂÂt see anything, through the camera it should appear as a normal light lighting up and flashing. If everything else seems to be going ok, but the TV¢ÂÂÂs just not obeying, it¢ÂÂÂs probably quite likely that something is wrong with the IR code. You can try the settings below, but there¢ÂÂÂs a chance that you may have to adjust them based on your particular chip and adapter. Try to Take It Further Try a suite of remote control commands to more fully control your tv, such as changing the channel and controlling volume. Choose it, and click ¢ÂÂÂinstall.¢ÂÂÂ Wait a while¢ÂÂÂit takes some time to download everything. The Alexa device costs pocket money, but use of the Echosim is free. By all means, feel free to examine, experiment, write your own, etc. Let¢ÂÂÂs send a signal through our IR transmitter and verify that the signal¢ÂÂÂs coming through. In the root installation directory for Arduino (e.g., C:\Program Files\Arduino), find the ¢ÂÂÂlibraries¢ÂÂÂ subdirectory. IR is invisible to the human eye, but there¢ÂÂÂs a pro-tip for testing it; run this code, verify (via the debugger) that it¢ÂÂÂs running on your chip, then open your mobile device¢ÂÂÂs camera. Will the tutorial work with an Echo simulator? Finally, we get to work with the popular ESP8266 chip, a favorite among do-it-yourselfers; it¢ÂÂÂs an amazing little chip with ability to run all sorts of things, with a built-in Wifi chip that we will need for this project. Good. AWS before doing anything), but they just have not. Our hack is not really a secret. Connect to Wifi First, we¢ÃÂÂre going to need to connect to the local wifi. Did you enter the correct username/password into the correct variable values? Please bear with me on my explanation, as I¢ÃÂÂm not an electronics or wiring guy, but the result of wrong-wiring the diode will be that the IR light will be ON by default, but turned OFF when the IRSend library intends to turn it on. If it¢ÃÂÂs not, then the command is not being received. This tutorial assumes that your Alexa device is set up and installed in home. ESP8266 connected to the adapter, next to Echo Dot ESP8266 with the IRI DIRIO ATTO DIGO. In the event that you would like to expand this tutorial and explore the limits of Cié that the chip can do, I recommend using my version. They only cost for a few USDs at the time of this writing. If it is, it seems that the command is received, but not managed correctly. Your device should receive it and send the remote control to TV. Is the diode IRI by issuing? We want Alexa to directly send a request to our ESP8266, above and inside our home WiFi network. Restart the Arduino Ide. The serial debugger output at this point should appear as the image below. Could! (But I haven't tested it). For this project, we only need functionality of sending; We are not interested in the reception of IR. Restart your Arduino Ide. If everything else fails, there is always the option to detect the code that emits the working remote control, when you press the power button - but this is a different tutorial and requires different hardware. Do you have many other devices detectable on your network? Each manufacturer tends to use their own owner protocol for commands and with different times; It is quite interesting and you can dig more thoroughly by examining the source code of that IR library, Googing, etc. As an additional bonus, we obtain a vision of the incorporated programming with Arduino, an skill that perhaps is not so common among traditional programmers these days. Problem resolution are you connected to wifi? Try the limits of the chip seeing how many different commands you can listen to an ESP8266 (suggestion: the number barely breaks the double figures, without very intelligent programming). You can view the diode via a cell phone camera to make sure it is emitted. In this case, the IR light should active (visible via the camera) by default, after the execution of the setup code (), but before anything thing It happens. Here is the command for Sony TVS (warning: untested): irsend.sendony (0xa90, 12); If you really want to do it yourself, you can set an IR receiver, point your remote (or any IR transmitter) and decode the codes it is sending; This is a different tutorial, though. As described above, when you think your device should issue, point your mobile phone camera and watch the diode through the camera. Here is only the code to open the WiFi connection, listen to Alexa Discovery's request and manage it by returning an answer "I'm an answer. Open tools -> tab: and this time, scroll down to "Generic ESP8266 Module" and select it. An ESP8266 chip. A local wifi network that you know the username and password. Enter debug messages to see if some code after if (len> 0) {it is running. Say “Alexa, discover the devices.” Wait until it reports success (it should have discovered at least one device). IR signal is reversed? The tutorial also gets dirty hands with Alexa using an unofficial "Hack" to convince Alexa to make our offers at home (this technique is not intended for use in production, only for demonstration at home). demonstration).
